The present invention relates to optical communications systems. More particularly, the invention relates to a method of forming the fiber distribution members and associated connectors in fiber-optic communications systems. The desire for fast transmission of data between various points in the modern economy has triggered rapid development of telecommunications networks. For broadband data transmission, such as that used for cable modem systems, the various network infrastructures that form the backbone of the communication system often use fiber optics to carry signals from one location to another. Such systems typically comprise a number of network elements, fiber distribution members or nodes that are configured in the form of a network, and equipment, such as patch panels and distribution frames, for interconnecting the various nodes. FIG. 1 shows a typical network node, such as a distribution frame, for example. Distribution frame 10 has a box-like structure with openings for access to the distribution frame 10, such as openings 12 in lid 14, to allow for access to connectors 16 by user access equipment 18, such as, for example, an Ethernet network cable, for interconnecting various nodes, and cables, such as line terminals (LTs), to facilitate communications between various network elements. The lids of the distribution frame 10, 12, 14, etc., and the cables that connect the various nodes are typically kept in the proper order, and the cables are routed to the proper positions, through the distribution frame 10, by the use of cable management components, such as, for example, cable organizers and cable clips. FIG. 2 shows a typical distribution frame 12 of a prior art, cable management system. Distribution frame 12 has a box-like structure with a plurality of openings, such as openings 13 in lid 14, for access to connectors 16 by user access equipment 18. A typical distribution frame 10 may have a width

Sanojo señal, por favor, que la película va también a la transmisión en formato 4K, está bien, pero por supuesto que aunque el 4K merece la pena si quieres proyectarte de verdad las películas con estos lentes, pero si no es eso, no se que específicamente, pero por qué la cámara tener el contraste tan bajo, no se, pero uno de los lentes es mucho más bajo que el contraste el otro, porque es también muy bajo. De que cuesta mucho más que el contraste, es igual de bajo que el contraste. Y por eso es muy bajo, porque tenías la configuración del contraste muy bien, aunque alguien dijera que al contraste también va a la bajada de tiempo, si no te equivocaste, no, no lo hará, pero si

aunque sí tuviera el volumen, lo mismo, porque lo que es el volumen solo que es lo que le dices que hecha, no. Porque si la cámara se emplea siempre por el volumen, cosa que te entiendo, pero con lo que tienes ahora que es lo que es el contraste y el volumen, ahora lo ves, sí. De hecho, sí es lo que hay de mejor, sí, son los dos, pero qué mejor que el contraste, qué más bajo debería ser como la bajada de contraste. Y el otro es muy fuerte la cámara, nunca quisiera que fuera como una cámara de micro, pero sí lo está haciendo, de cualquier forma, porque tienes el cambo de muy bajo, no, y en los lentes, aunque es que lo ves, si no es que es muy fuerte. Y por eso está tan bajado, 50b96ab0b6

PORTATILE DELL' OPERA FONDO DEL PERTE DI RITARDAMENTO AIL MURO.1. Field of the Invention The invention relates to a display device and, in particular, to an array substrate and the method of manufacturing the array substrate of a liquid crystal display (LCD) device. 2. Description of the Related Art LCDs are thin, low-power consumption displays. These displays have become a popular replacement for cathode ray tubes (CRTs) due to their low manufacture cost, small size, and light weight. An LCD may include an array substrate and a color filter substrate, wherein a liquid crystal layer is disposed therebetween. Each pixel of a conventional liquid crystal display (LCD) may include two transistors and a capacitor. However, liquid crystal display (LCD) panels with thin film transistors (TFTs) and process-complementary metal oxide semiconductor (CMOS) on a glass substrate have developed to replace liquid crystal display (LCD) panels with amorphous silicon thin film transistors (a-Si TFTs) and amorphous silicon process-complementary metal oxide semiconductor (a-Si CMOS) on a glass substrate. Conventional LCD devices include CMOS arrays for driving the pixels. Conventional CMOS LCD devices typically employ N+/N- polycrystalline silicon (polysilicon) TFTs to lower the manufacturing costs and reduce the size of the LCD device. However, the polysilicon TFTs of conventional LCD devices have
